Vision

1. Vision Statement

Some IT Professionals would love to have an online dating service that pairs members based upon certain technical skills or abilities. LookingForLove is the only dating application that hopes to pair IT professionals with their ideal love candidates using their technology skills/abilities as search criteria. There is no need to provide manual searching since the system will automatically suggest candidates based upon the desired skills list.

2. Product Features

- Profile Capture
  - Basic Demographic information
    - Salutation, First Name and Last Name
    - Member Photo
    - Technical Skills possessed; Technical Skills desired in another person.
    - Communication method / information
- Auto Matching
  - The system will automatically present in ranked order from closest to least close match.
- Communication
  - If you want to communicate with of the members displayed, you will need to select the match. By selecting a match, the communication contact information will be displayed. Once you have the contact information the user is free to use another app (not developed by us to communicate) with a potential candidate.
  - Each time the contact information is requested by select a member, the system will keep track of this information and count it as a successful match. This information will be captured in a data store that will be used in a real-time dashboard that is available to management only.
- Statistics Dashboard
  - How many free members are registered for the application?
  - Total number of current paid members.
  - Total number of matches where the communication information was exposed as part of the matching process. From inception until now.

Stakeholder and User Roles

2.1 Stakeholder Summary

Name	Responsibilities
Brian Turford	Product Owner

2.2 User Roles

Name	Description
Free Member	Any person who can create a profile and search for potential candidates.
Paid Member	In addition to the capabilities of a free member, a [aid member can communicate with potential matches and ask them out on dates using this service. There is one time fee of $500 to join our service as a paid member.
Product Manager	A product manager is responsible to understand the number of users and the successful number of matches that occur so that they can best manage the marketing and social media efforts associated with this application.

3. Product Backlog (Functional Requirements)

Priority	As a	I want to	So that I can	Relative Estimate	Estimated Cost
1	Member	Log into the application using an appropriate verification method	Securely access my account.		
2	Member	Capture basic profile information	Describe my skills and background to other members when viewing profiles.		
3	Member	Maintain (update) my profile information	Keep my profile accurate and up to date over time.		
3	Member	Capture a high-level list of skills/abilities and other criteria used for matching purposes	Provide information that can be used by the matching engine when matching is enabled.		
4	Paid Member	View automated match recommendations based on my profile information and preferences	Review the best candidates to contact.		
5	Paid Member	Expose member communication contact information where permitted.	So that paid members can initiate contact with members of interest.		
6	Product Manager	View a management dashboard displaying user statistics	Understand how many users are utilizing our service.		
7	Paid Member	Provide feedback on the quality of a match using a simple rating	Help assess how effective the matching process is		

Note: The term "Member" refers to both Free Members and Paid Members.

4. Project Constraints and Technical Considerations

It may be best to use a series of tags to capture the skills of an individual for matching purposes.
Students are allowed to utilize any development stack and platform that they deem appropriate for this application.
Teams will work in project groups and are responsible for planning and managing their work collaboratively throughout the project. Teams may divide requirements or tasks among members based on perceived complexity and skill sets, and are expected to support one another to ensure overall project progress. **For planning and estimation purposes, teams should assume a minimum of 3 hours of development time per student per week. This assumption is used to calculate capacity and velocity only; in practice, additional effort may be required to complete the project successful.**
You do not need to use database to store the data. Since the development stack is of your choosing you can decide where and how to store the data.

5. Development Notes

The following notes are sorted by User Story.

Log into the application using an appropriate verification method	You are free to develop any method for login that you think is appropriate for this application. There is no need for a password reset since this is an early version of the application.
Capture basic profile information	For each member the following should be captured: • Salutation • First Name • Last Name • Nickname • Date of Birth • Gender • Photo is Optional • Email address • Preferred contact method and identifier (ie. email address, messaging handle, social profile etc.) • Member type: Free or Paid *This list represents the minimum required profile information. Teams may capture additional information if they believe it adds value, provided it does not conflict with project scope or other constraints.*
Capture a high-level list of skills/abilities and other criteria used for matching purposes	Each member can specify the ranked criteria that will be used when pairing members. Ultimately members will be able to perform manually searches and/or the system will generate a list of close matches. For this version only automated matches are possible. The manual search ability will be implemented in a future release of the product.
View automated match recommendations based on my profile information and preferences	Display a picture or the member if it is available or a generic image for each member in the matching result set. Display the name of the person, there approximate age and list of skills reported.
Expose member communication contact information where permitted.	When you find a match that you would like to contact, you should indicate your interest using a simple action (e.g., pressing a button or similar interaction). The system should display the matched member's preferred external communication method so that contact can occur using standard communication applications outside the system. The application must not implement an in-app messaging or chat system. Members will rely on external communication platforms to contact their match.
View a management dashboard displaying user statistics	There are three key criteria that need to be tracked and displayed on the dashboard. How many free members are registered for the application, the total number of current paid members, and the total number of matches where the communication information was exposed as part of the matching process. Lastly what is the total number of matches to date.
